

INFECTION ASSIGNMENT

Completed Using Chapter 18: Immune System Function, Data Collection, and Therapeutic Measures

Name: __JOSEPH BIDIAS

Date: ____09/06____

Instructions: The original worksheet has been rewritten with each answer directly under its question. For the crossword section, the grid is intentionally omitted; only the clue-to-term associations are provided, as requested.

Part I — Medication and Immunity Associations

1. _____ is prescribed to treat bacterial infections. Bacteria are characterized and named in part by their shapes and by whether they retain Gram stain as gram-positive or gram-negative.

Answer: ANTIBIOTICS

2. _____ are used to treat fungal infections such as tinea pedis and candidiasis. Fungi may live on the skin or inside the body.

Answer: ANTIFUNGALS

3. _____ are used to inhibit viral reproduction and may be used for viral illnesses such as herpes, chickenpox, and shingles.

Answer: ANTIVIRALS

4. _____ are used to block the histamine response, helping decrease swelling, itching, and congestion. They may also be part of treatment for allergic reactions.

Answer: ANTIHISTAMINES

5. _____ relieve nasal congestion and promote drainage; they are generally used for a limited period according to the worksheet.

Answer: DECONGESTANTS

6. _____ suppress the body's inflammatory response. They are generally used cautiously because prolonged use can cause important adverse effects and immune suppression.

Answer: CORTICOSTEROIDS (GLUCOCORTICOSTEROIDS)

7. _____ are used as a long-term approach for significant allergies by gradually exposing the patient to increasing amounts of an allergen to build tolerance.

Answer: IMMUNOTHERAPY (ALLERGY SHOTS)

8. _____ are used to treat parasitic infections and diseases.

Answer: ANTIPARASITIC

9. _____ help provide long-term immunity after vaccination or recovery from illness and can provide passive immunity to a newborn through placental transfer.

Answer: IgG ANTIBODIES

Part II — Infection Puzzle: Associations Only

Important: The crossword grid is not reproduced or completed. The clues are rewritten below with the matching term only.

Rewritten Definition	Association / Answer
Thick fluid caused by infection that contains white blood cells and cellular debris; may appear white, yellow, pink, or green tinged.	PURULENT
Dead tissue caused by infection or lack of blood flow.	GANGRENE
Pus-forming bacteria released from an abscess.	PYEMIA
Swollen, inflamed skin infection.	CELLULITIS
Presence of bacteria in the blood.	BACTEREMIA
Pale-yellow colored discharge.	SEROSANGUINEOUS
Blood-colored discharge.	SANGUINEOUS
A life-threatening complication of an infection.	SEPTICEMIA
A confined pocket of pus that collects in tissues, organs, or spaces inside the body.	ABSCESS
Clear-yellow, watery discharge.	SEROUS
Death of cells or tissue through disease or injury.	NECROSIS

Chapter 18 Source Notes

- IgG: Chapter 18, Table 18.1 states that IgG provides long-term immunity after vaccination or illness and crosses the placenta to provide passive immunity in newborns.
- Immunotherapy: Chapter 18 describes subcutaneous immunotherapy (SCIT) and sublingual immunotherapy (SLIT) as allergen desensitization approaches.
- Medication categories: Chapter 18 key points list antibiotics, antihistamines, antivirals, corticosteroids, decongestants, and other immune-system medications.
- Some worksheet items (especially antifungals, antiparasitic drugs, and several wound/infection vocabulary terms) are not directly defined in the uploaded Chapter 18 pages; those answers are matched from the worksheet's own word bank and clues.
